

Your servers, our Cloud, the best service in the industry. Apollo Office Systems gives you on-demand capacity with the best infrastructure tools and utilities in the industry.

The goal of CloudServer is to provide a flexible, standardized and virtualized operating environment that allows applications to perform at their peak without downtime. Infrastructure as a Service (IaaS) abstracts hardware (server, storage and network infrastructure) into a pool of computing, storage and connectivity capabilities that are delivered as services for a usage-based (metered) cost. Leveraging our infrastructure allows you to operate like an enterprise-level organization, no matter what size you are.

With CloudServer, you will also receive the benefits of Disaster Recovery. There are a myriad of ways to lose equipment and data, whether it is fire, theft or malfunctioning sprinklers. Apollo Office Systems's CloudServer houses your data in secure Tier 3, Class 1 data centers that are mirrored and securely backed up. This gives your services the ability to be quickly back on-line and running smoothly in the event of a disaster. Our infrastructure resides in multiple data centers so clients can be assured that their business critical applications and data will be fully redundant in a different data center, making it easier to resume business as usual.

CloudServer has a pay-as-you-go model which allows you to scale up or down depending on your needs. Quickly seize new opportunities and get projects up and running with the scalability of our solution. When it comes to pricey hardware, you can save a lot by using our infrastructure and buying only what you use. With IaaS, eliminate the many negative aspects of IT expansion, especially issues with in-house infrastructure, while still receiving the processing power and storage space that you need to run.

CloudServer is based off of enterprise-class infrastructure at a fraction of the costs with 24x7x365 friendly and reliable support. We care about your business' uptime objectives and security, which is why Apollo Office Systems has worked hard to become a leader in CloudServer. With your applications built into a private cloud environment that includes encryption, firewalls and advanced around-the-clock monitoring, they will remain safe and secure. Operate worry-free, knowing that you always have Apollo Office Systems's support.

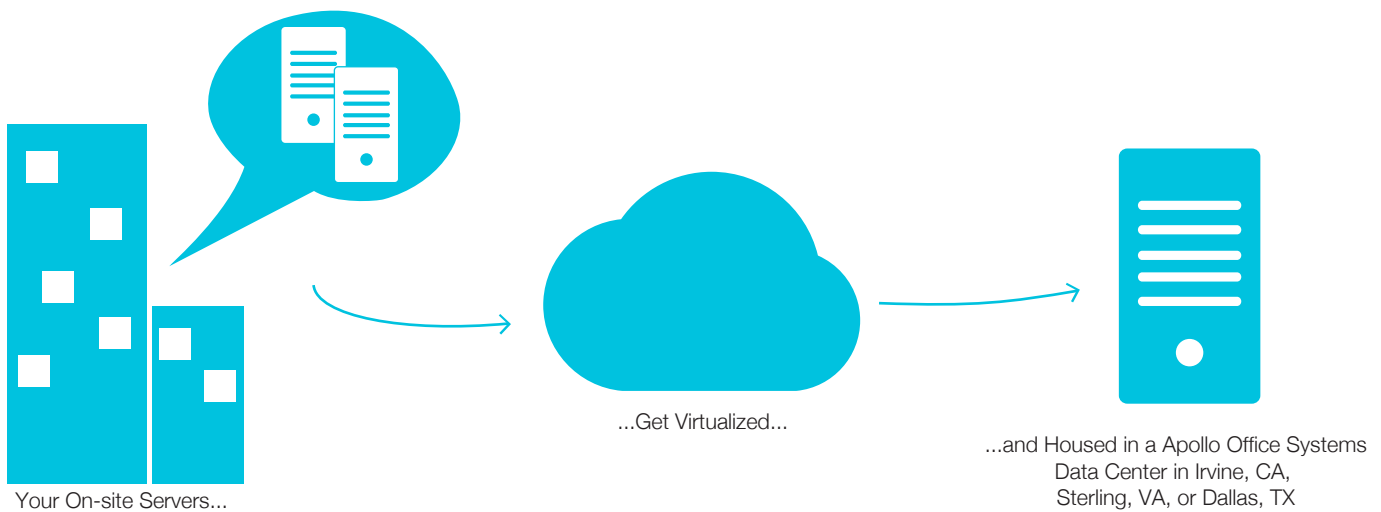

Benefits of CloudServer

- Smart Build Data Centers
- Cisco Routers & Switches
- Cisco & SonicWALL Firewalls
- Cisco UCS Blade Servers
- NetApp Storage
- VMware
- Citrix
- Scalable
- Secure
- Available
- Cost Effective
- 100% Uptime Guarantee
- Advanced Monitoring
- 24x7x365 Support

With your infrastructure hosted off-site, you free up your IT staff to focus on value-added tasks, such as planning and development, instead of running around patching machines and fixing bugs. Reduce risk, eliminate headaches and save money with CloudServer.

Our CloudServer product set runs on the same hardware and network infrastructure as the rest of our products. This includes our own internal resources such as email, VDI and file storage. To prove our confidence in our infrastructure, we are our own customer. Backed by NetApp storage, Cisco UCS network & compute, VMware Hypervisors, and a true 10Gb network backbone to link it all together, CloudServer employs the best-in-breed hosting platforms in a fully redundant configuration to ensure the highest level of service availability possible. This means that at least one, if not multiple, appliances, cables, or power sources from each layer in the stack can simultaneously fail with little to no impact to your services and productivity.

How Does It Work?
